CORRECTION FACTORS

The outputs shown within this brochure are based on BS EN442. BS EN442 specifies that all outputs must be stated at ΔT 50°C, which is based on 75-65-20°C operating conditions.

The ΔT is calculated by taking the mean water temperature and deducting the ambient air temperature.

For example, a typical air-source heat pump system will have flow temperatures of 45°C and return temperatures of 40°C. With an ambient air temperature of 20°C, this means the system is operating at ΔT 22.5°C.

To calculate the output of a radiator at operating conditions other than ΔT 50°C, multiply the listed output by the correction factors shown in the table below.
